Name : MRS M.R.D.M.R.GUNARATHNE
 Test : Histology of Resection Specimen
 Ref.By : Dr. Chinthana Hapuarachchi
 Collection Date : 2024-09-24 14:06:00
 Date of Receipt : 2024-09-24 14:15:03
 Date of Report : 2024-10-23 12:19:56

Clinical details : Diagnosed with low grade adenocarcinoma of the endometrium.

Specimen/Site :

Specimen Details

: A - Uterus with bilateral fallopian tubes and ovaries
 B - Left pelvic lymph nodes
 C - Right pelvic lymph nodes
 D - Omentum

Macroscopy

: A - Received a specimen consists of uterus with cervix, attached bilateral fallopian tubes and bilateral ovaries. Uterus with cervix measuring 80 x 50 x 20 mm. Right fallopian tube with fimbrial end measures 50 x 10 mm. Right ovary measures 30 x 20 x 15 mm. Left fallopian tube with fimbrial end measures 55 x 10 mm. Left ovary measures 30 x 20 x 12 mm. Outer surface of the uterus is smooth. Cut sections reveal an endometrial growth arising from the fundus. The growth is flashy and tan in colour. It extends up to the uterine body measuring 25 x 20 x 12 mm. Endometrial cavity is enlarged. Uninvolved endometrium is 02 mm in thickness. Myometrium is 20 mm in maximum thickness. At the maximum invasion site myometrial thickness is 05 mm.

B - Received multiple pieces of fatty tissue with lymph nodes collectively measuring 60 x 55 x 20 mm. Seven lymph nodes are identified. Largest lymph node measures 20 x 08 x 06 mm.

C - Received multiple pieces of fatty tissue with lymph nodes collectively measuring 65 x 50 x 20 mm. Ten lymph nodes are identified.

D - Received a segment of omentum measuring 230 x 50 x 10 mm. Macroscopic thicken areas are not seen.

Microscopy

: A - Sections of the uterus show an endometrial carcinoma of endometrioid type forming a polypoid mass. The tumour shows granular and papillary structures lined by columnar epithelial cells with enlarged moderately pleomorphic vesicular nuclei. Scattered mitotic activity is seen. (FIGO grade 1) The tumour infiltrates myometrium up to 60% thickness. Maximum invasion is seen in the anterior myometrium.

Clearance to serosa at the maximum invasion is 2.7 mm.
The tumour extends to fundus to the lower segment.
The cervix is free of tumour involvement and contains tunnel clusters. No lymphovascular emboli are seen.
Bilateral parametrial tissue / both ovaries , tubes are free of tumour invasion and appear unremarkable.

B - All seven left pelvic lymph node are free of tumour deposits.

C - All ten right pelvic lymph nodes are free of tumour deposits.

D - Omentum appears unremarkable. No tumour deposits are seen.

Conclusion(s)

: Appearances are consistent with well differentiated (FIGO grade 1) endometrioid carcinoma of the endometrium. The tumour involves the entire endometrium and infiltrated to myometrium up to 60% of its thickness anteriorly. Clearance to serosa at the maximum point is 2.5 mm. Cervix is free of tumour involvement. No lymphovascular tumour emboli noted. Bilateral parametrial tissue, ovaries and fallopian tubes are free of tumour involvement. Bilateral pelvic nodes and omentum are free of tumour deposits. FIGO stage - IB
