Histopathology

Specimen : R/S Hemicolectomy specimen

Macroscopy : R/S Hemicolectomy specimen measuring 180mm in length received. The ileum - 20mm in length and the caecum and proximal large bowel/right colon measures 150mm in length. The proximal margin is 15mm and the distal margin is 20mm in diameter. The appendix is 35mm in length. Cut open bowel reveals an obstructing / stricturing tumour which is 20mm in length and located 50mm from the distal end resection margin. There is serosal puckering at the point of the tumour with adherence of fat at this point. Cut surface of the tumour reveals a tumour infiltration into the pericolic fat.
 16 lymph nodes retrieved. (+ 2 lymph nodes adjacent to the tumour)

Key to blocks
 A. Proximal end resection margin.
 B. Distal end resection margin.
 C-E. Tumour to serosa with attached omental fat.
 F-H. Tumour to pericolic fat.
 I. Apical lymph nodes
 J-O. Lymph nodes.
 P. Appendix.

Microscopy
 These are sections of a well differentiated adenocarcinoma (G1-2-low grade) infiltrating the bowel wall with infiltrative margins and extending into the peri colic fat. There is evidence of the serosal involvement in blocks (D) and (E) - pT4.
 There is low grade tumour budding evident focally.
 There is no evidence of a significant host lymphoid response - Grade 0
