HISTOPATHOLOGY

LARGE SPECIMEN OTHERS

Specimen DESCENDING COLON TUMOUR

Macroscopy
Segment of colon measuring 120mm in length received. The opened out (proximal margin) is 55mm in circumference and the stapled margin (distal) is 25mm in diameter. There is a puckered and depressed area on the serosa 45mm from the proximal margin and 50mm from the distal end resection margin. The cut surface reveals a constricting circumferential tumour 20mm in length. The tumour does not appear to infiltrate the pericolic fat on macroscopy. 13 lymph nodes were retrieved from the pericolic fat.

Key to blocks
Proximal end resection margin.
Distal end resection margin.
C-E. Tumour to serosa
F-G. Tumour.
I. Apical Lymph nodes
J-P. Lymph nodes

Microscopy
These are sections of a well - moderately differentiated adenocarcinoma (G2- Low grade) which is seen infiltrating the pericolic fat minimally (Block D) with both broad pushing margins and infiltrative margins - pT3. Tumour infiltration beyond the outer border of the muscularis propria into the pericolic fat is only 0.2mm. There are occasional foci of high grade tumour budding. No serosal involvement evident. No lymphatic vascular or perineural invasion present -Ly0 V0 Pn0 Stromal tumour infiltrating lymphocytes are mild (5 - 10%) The end resection margins are free of tumour. There is no evidence of any associated bowel pathology. Three of the 13 lymph nodes isolated reveals metastases - pN1b

Table with 3 columns: Test Report Status, Final, Results

Conclusion DESCENDING COLON TUMOUR

Well - moderately differentiated adenocarcinoma
G2 - low grade
pT3 pN1b
Tumour length - 20mm.
Ly0 V0 Pn0
High grade tumour budding evident.
sTIL- mild (5-10%)
End resection margins are free of tumour
3/13 lymph nodes contain metastases - pN1b
